

A6: Sketching and Critique

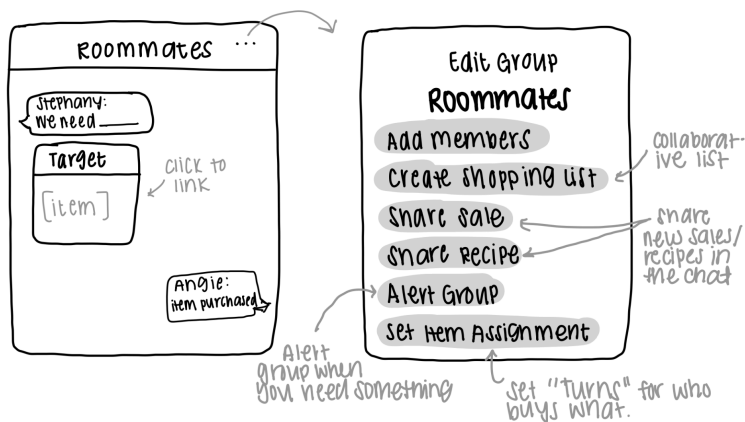

Angelique Carrillo

Here I have three sketches focusing on three main ideas our team would like to pursue for our design after brainstorming.

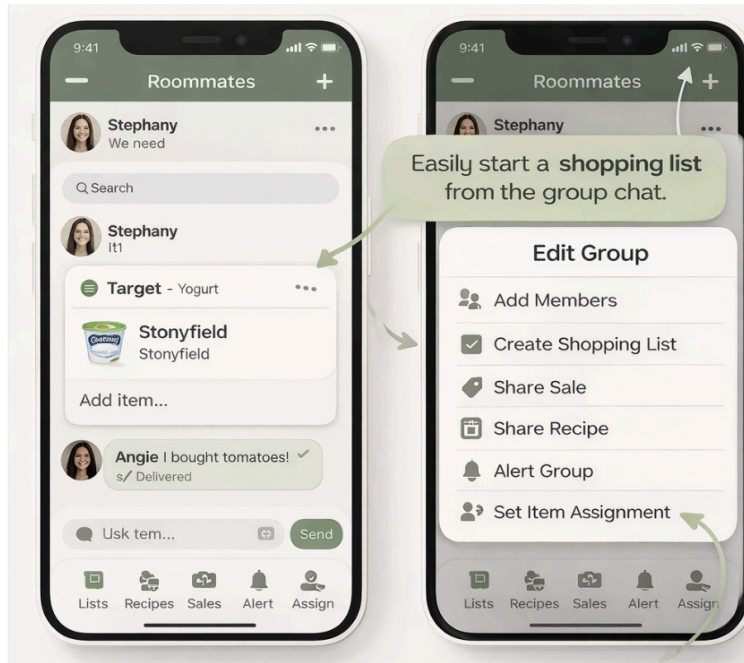

The first is a collaborative feature that allows you and others to create shared grocery lists, send recipes/sales, and alert when an item at home has run out and needs to be replenished. Additionally, you can alert your group when a shared item has been purchased so you can properly keep inventory, avoid overspending, and avoid waste.

Sketch 1:

Collaborate

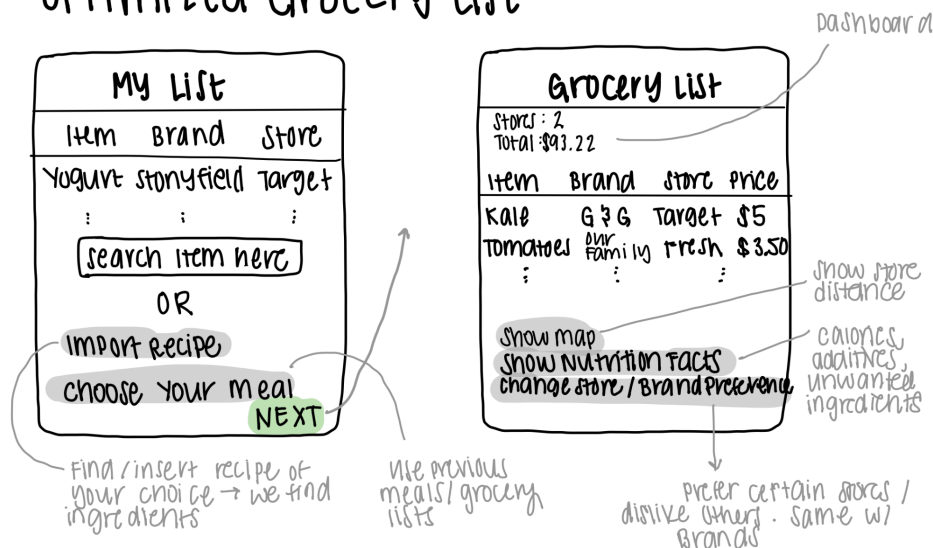

This biggest issue was the lack of vision for the "Edit Group" feature. Here is where all of the sharing, alerting, and settings are formed. To fix the issue I created an AI photo of the image so it could be more clearly displayed.

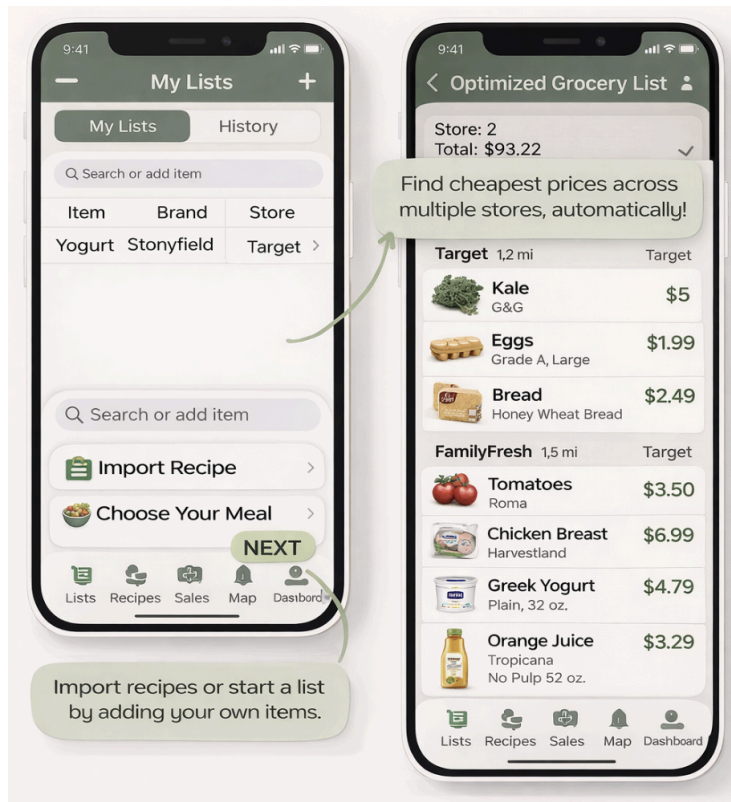

Sketch 2: In this sketch we see the optimized grocery list. You create your list by searching for items, importing recipes, or using previous recipes/grocery lists to autofill your grocery list. We allow for store & brand preference to avoid adding items or stores you do not want. After entering your items the optimized grocery list appears with a small dashboard should you price and store information. Next you will see the items with their corresponding brand, store, and price. You may edit your store/brand preferences or choose to see a map of the store you will go to.

Optimized Grocery List

The generated image addresses a few issues with spacing on my design. The dashboard was messy and there was no images for the foods one was buying. Visuals were very important for those we interviewed, so not only having visuals for pricing but also items will be helpful.

Sketch 3: Finally I created a design for a dashboard to show spending limits, set budgets, and how those budgets are spent (e.g. food, health, other). This not only tracks financial aspects but tracks inventory. It will show you recently purchased items to prevent you from making duplicate purchases and guiding meal preparations, and shows you what you might run out of soon to guide grocery list creation.

dashboard

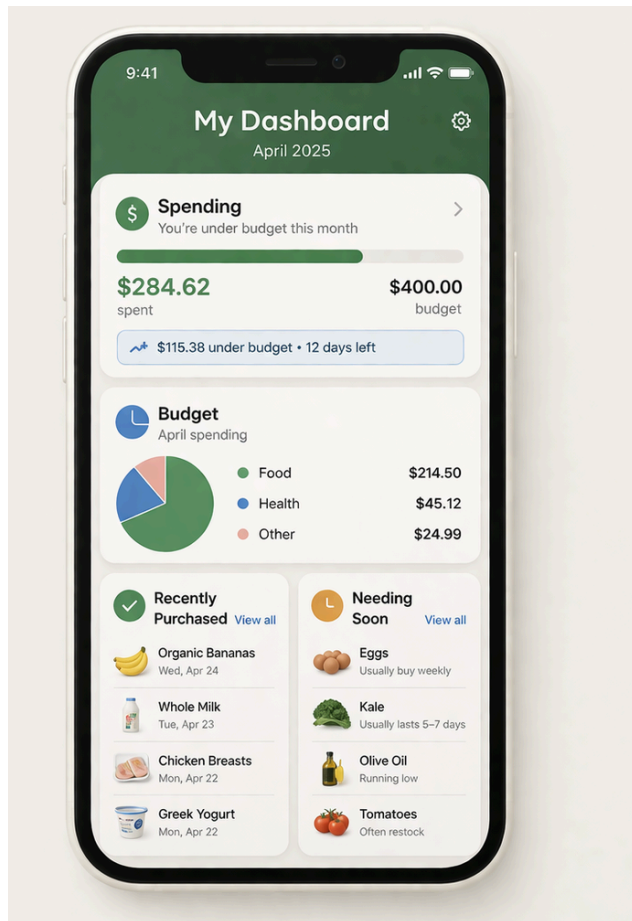

Track spending habits / budget

See if you're over or under budget

Keep inventory of what you've bought recently, and what you might need soon.

Critiques included lack of visuals for the actual budget. Meaning you could not see how far over or under the budget you are which could be confusing. Additionally, a pie chart is not enough for visualizing what you have spent in each category, actual numbers need to be shown to make a real impact on future decisions.

Critiquing process:

The constructive criticism was helpful from my groupmates since it is helpful to get advice from someone with a fresh perspective. I had been staring at my sketches for some time and they were able to help me realize some aspects that I was overlooking. I was able to jot these things down on my sketches and feed this into the AI photo generator which then also helped me produce the design I was going for.

Next time I would enjoy doing this in person so I can see first hand reactions to the sketches. Leaving comments is helpful but seeing true expressions and behaviors would have helped me see any confusion.
